

Stop Spam Upstream
Get rid of Spam and email Viruses before they reach your network

- ▶ Complete Spam & Virus protection
- ▶ Anti-spoofing, anti-phishing
- ▶ Scans attachments for spyware
- ▶ End-user block / allow lists
- ▶ Low cost, no per-user charges

Spam never sleeps! Fighting an ever-changing attack of unwanted message and email virus threats is costly and takes continued IT time. Unlike spam filtering software and appliances that operate inside your network, Barracuda Spam Filtering is a preemptive approach to stopping spam. Spam filters reside between the Internet and your network to stop spam and viruses before they reach your network, consume your bandwidth or monopolize your IT staff.

- No software to install
- No hardware to maintain
- No modifications to your existing email system
- Affordable

Easy Set Up

- No user disruption
- Real-time customer support
- Automatic updates for the most current protection

Protect/Secure

- Anti-spam—advanced detection filters, low false positives
- Anti-virus—dual layer blocking
- Anti-spoofing—"spoofed" sender addresses
- Anti-phishing—stop attempts to steal confidential information

Custom Configure

- Set spam policies on a per domain basis
- Provide end-user allow / block lists
- Provide end-user quarantine mail boxes
- Send daily / weekly quarantine box reports
- Set up global quarantine email box (disables personal boxes)
- Allow filtering shut-down on an individual

Affordable

- Low annual or monthly fees, no per-user charges
- Low initial startup costs

THE TRUSTED SOURCE FOR SPAM, SPYWARE, VIRUS AND CONTENT BLOCKING

Technology includes:

Blacklisting to maintain up-to-date lists of large known spammers, compiled from anti-spam databases and groups. This is a living list that grows daily and is automatically updated automatically for each customer.

Keyword scanning methods include scoring systems for emails based on multiple criteria. If the email score exceeds defined thresholds, it is flagged as spam. We constantly monitor and update our keywords' master library so you don't have to.

Checksum technology tracks the number of times a particular message has appeared. If the message frequency exceeds threshold, it is blocked as spam.

Message authenticity check uses multiple algorithms to verify authenticity of a message. Some are simple checks such as "from address," and others are more complex, relating to SMTP protocol.

Blacklists / Whitelists include Domains, IP's, and email addresses that the customer wants Blacklisted (blocked) or Whitelisted (allowed through). Lists are maintained per user and per domain.

Rate controls are used to stop denial of service attacks as well as other service attacks.

State-of-the-Art, Fail-Safe, and Secure redundant Network Operations Centers across the US. Multi-layer security control procedures, Uninterruptible redundant AC/DC power.

Number of Email Accounts

Charges	1 - 25	26-50	51-100	101-200	201-300	300+
Non-Recurring
